

GlueOps Captain Domains

Your **captain domain** is the base domain for your GlueOps cluster. Platform services like ArgoCD and Grafana are all accessible under it, and it serves as the default base domain for application routing.

! INFO

The captain domain is automatically provided by GlueOps as part of its service.

Let's break down the components of a GlueOps captain domain using an example:

```
<cluster>.<tenant>.onglueops.<tld>
```

For example: `nonprod.antoniostacos.onglueops.com`

The domain consists of the following parts:

- Cluster Identifier (`nonprod`)**: Identifies which cluster this domain belongs to. Organizations typically run separate clusters per environment — for example, `nonprod` and `prod`.
- Tenant Key (`antoniostacos`)**: Your organization's identifier on the GlueOps platform. This remains the same across all of your clusters.
- Core Domain (`onglueops.com`)**: The base domain for GlueOps tenant services.

Application Routing

By default, applications deployed to the cluster use hostnames under `apps.nonprod.antoniostacos.onglueops.com`. For example, an app called `api` could be reachable at `api.apps.nonprod.antoniostacos.onglueops.com`. The exact hostname is defined in each app's routing configuration (IngressRoute or Ingress), so you have full control — including the option to use your own custom domains entirely.
